

1984
Assume

Let f be the acceleration of pulley A.
Let p be the acceleration of D relative to pulley C.

<p>A mass 8kg accel. $f \uparrow$ forces $5 \uparrow, 5 \downarrow, 8g \downarrow$ IF $2S - 8g = 8f$ (1)</p>	<p>B fixed Ext.</p>	<p>C 0 $2f \downarrow$ $T \uparrow, T \uparrow$ $S - 2T = 0$ (2)</p>	<p>D 2kg $p \uparrow, 2f \downarrow$ $T \uparrow, 2g \downarrow$ $2g - T = 2(2f - p)$ (3)</p>	<p>E 4kg $p \downarrow, 2f \downarrow$ $T \uparrow, 4g \downarrow$ $4g - T = 4(p + 2f)$ (4)</p>
--	------------------------------------	--	---	---

want to find f and p don't need S and T .

$2S - 8g = 8f$
 $S - 2T = 0$
 $T - 2g = 2p - 4f$
 $4g - T = 4p + 8f$

Sub $\Rightarrow 4T - 8g = 8f \Rightarrow T - 2g = 2f$ (*) **NoS**
 Add $\Rightarrow 2g = 6p + 4f$ (Δ) $\Rightarrow g = 3p + 2f$ (Δ)
 Add $\Rightarrow 2g = 4p + 10f$ (□) $\Rightarrow g = 2p + 5f$ (□)

Add (Δ) and (*) $\Rightarrow 2g = 4p + 10f$ (□) $\Rightarrow g = 2p + 5f$ (□)

Now just (!) solve (Δ) and (□)

(Δ) $\times 2 \Rightarrow 2g = 6p + 4f$

(□) $\times 3 \Rightarrow 3g = 6p + 15f$

subtract $\Rightarrow -g = -11f \Rightarrow f = \frac{g}{11} \text{ms}^{-2}$

(Δ) $\Rightarrow g = 3p + 2\left(\frac{g}{11}\right)$
 $\Rightarrow p = \frac{3g}{11} \text{ms}^{-2}$

<p>Accel A = $\frac{g}{11} \text{ms}^{-2}$</p>	<p>Accel C = $\frac{2g}{11} \text{ms}^{-2}$</p>	<p>Accel D = $\frac{3g}{11} - \frac{2g}{11}$ $= \frac{g}{11} \text{ms}^{-2}$</p>	<p>Accel E = $\frac{5g}{11}$ $(2f + p)$</p>
